algolysis

handling large shared atomic data

### **OBJECTIVES**

 $\frac{\alpha}{\lambda}$ 

Challenge: Keeping Everything in Sync

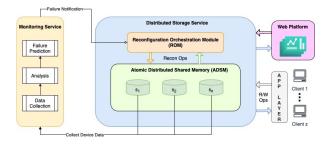

Maintaining consistent data across multiple devices can be difficult due to network delays and potential message loss. Atomic Distributed Shared Memory (ADSM) tackles these issues and is a cornerstone of our research. **ADSM: The Key to Reliable Storage** 

ADSM: The Key to Reliable Storage

ADSM creates the illusion of a sequential memory space over asynchronous, fail-prone, message-passing nodes. Existing ADSMs face challenges such as large data support, speeds, liveness, and scalability.

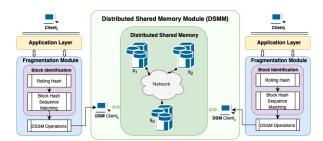

## **Our focus: Distributed Storage Solutions**

We develop algorithms for a Distributed Storage Service (DSS), ensuring strong consistency, large data handling, and high concurrency, even in dynamic environments with changing nodes.

#### **KEY CONTRIBUTIONS**

- CoBFS Framework: Fragmentation strategy for handling large data, maintaining strong consistency, and allowing concurrent modifications.
- Integrate the Dynamic ADSM ARES with CoBFS: Provides dynamic reconfiguration and fault tolerance.
- Performance Improvement: Distributed Tracing identifies bottlenecks. Optimizations minimize communication overhead.
- Evaluation and Comparison: Tested on emulation and overlay testbeds. Competitive performance against commercial solutions.

#### **OPTIMIZING ADSM: Insights from Distributed Tracing Analysis**
